ATOMIC AQUATICS SV2 SNORKEL

€69,00

Semi-Dry Flex Snorkel

The SV2 is designed to limit splashed water from entering the breathing tube, by combining the Scupper Valve lower section with the sleek looking SV2 Semi-Dry top. SV2 is the perfect snorkel for rough or choppy water conditions.

SV2 SNORKEL - A BREATH OF FRESH DESIGN

Semi-Dry Flex Snorkel

The SV2 is designed to limit splashed water from entering the breathing tube, by combining the Scupper Valve lower section with the sleek looking SV2 Semi-Dry top. SV2 is the perfect snorkel for rough or choppy water conditions.

SV2 FLEX: HIGH-PERFORMANCE DESIGN WITH A SEMI-DRY TOP

The SV2 includes a Scupper Valve lower section with a sleek semi-dry top. The SV2 semi-dry top employs horizontal vents engineered to diffuse splashed water that would normally freely enter the snorkel top. The small gaps between the vanes of the vent restrict water speed and droplet size and permit most of the splashed water to exit the special vents without entering the breathing tube. The end result is less water in your snorkel. The SV2 is perfect for rough or choppy water conditions.

SV2 with Semi-Dry Top

PERFECT FOR USE IN CHOPPY WAVES

The SV2 combines the same Scupper Valve lower section with the sleek and effective SV2 Semi-Dry top. The SV2 Semi-Dry top horizontal vents (1) are engineered to diffuse splashed water that would normally

freely enter the snorkel top. The small gaps between the vanes (2) of the vent restrict water speed and droplet size and permit most of the splashed water to exit the special vents (3) without entering the breathing tube. Thus, you get less water in your snorkel. The SV2 is the perfect answer for rough or choppy water conditions.

FEATURES AND BENEFITS OF THE SV SERIES HIGH PERFORMANCE SNORKELS

The Scupper Valve (SV) design is self-draining and delivers crisp, effortless clearing. Posi-lock flex retainer secures flex section and mouthpiece. (1) Dual silicone mouthpiece prevents over-clenching of teeth that would restrict air flow. (2) Rotational mouthpiece with ratchet indicators. (3) SV1 has a conical flared top for high performance breathing. SV2 Semi-dry top is designed to limit splashed water from entering the breathing tube.

ATOMIC EVEN DESIGNED A BETTER SNORKEL KEEPER

- Quick disconnect snorkel keeper includes 30 degree rotation.
 - Sliding snorkel keeper range adjuster allows for accurate placement without constant re-adjusting each dive.
 - Atomic Aquatics' international and award winning styling team makes the SV1 and SV2 high performance snorkels something you would be proud to use.
-

The SV1 features a conical flared top and is available with contour or flex lower section

HIGH-PERFORMANCE DESIGN WITH CONICAL FLARED TOP

Every snorkel model in the SV Series includes the Scupper Valve on the bottom mouthpiece section. Then, Atomic gives divers a choice of tops to best suit their needs. The SV1 design has a conical flared top to deliver maximum airflow. The SV1 is the optimal choice for calm waters or for strong swimming situations. Even though water may enter the open top, the internal tube airway remains dry. Any water trapped below the mouthpiece is easily cleared with a small burst of exhaled air. The flexible lower section drops the mouthpiece out of the way when not in use.

SV SERIES — HOW THEY WORK

Just like the one-way Scupper Valve on a boat, the lower section of both the SV1 and SV2 (semi-dry) enable water to be easily expelled. Any water entering the top of the snorkel (1) bypasses the mouthpiece completely and exits out the purge valve (4). If water did enter the internal tube (2) located inside the main snorkel body, it contains a small one-way Scupper flap valve (3) designed to allow water to flow past the mouthpiece and out the purge valve (4) without collecting at the bottom of the breathing passage. The diver simply exhales a small burst of air to clear any water trapped below the mouthpiece, and the internal tube airway is kept dry. It's so simple and so effective we have a patent pending!
